Ruben Lekli

London, United Kingdom +447729711592 lekliruben@gmail.com LinkedIn GitHub Portfolio

Backend engineer with founding experience building real-time operational systems and stateful platform architecture. Shipped production systems coordinating complex multi-service state changes across distributed teams; comfortable deploying to live operations, understanding constraints, and iterating based on field requirements and operational reality.

CORE COMPETENCIES

- **Backend & Real-Time Systems:** Stateful service architecture, multi-service coordination, real-time data synchronisation via WebSocket, event-driven systems, constraint-based scheduling, gRPC, REST APIs, message queues, state machine design
- **Languages & Frameworks:** Go (Golang), Python, TypeScript, JavaScript; Go Fiber, FastAPI, REST/WebSocket APIs, Playwright; C++, Java
- **Data & Infrastructure:** PostgreSQL, MongoDB, SQLite; AWS (EC2, RDS), Docker, Docker Compose, Linux VPS provisioning and hardening, Prometheus metrics and observability
- **Algorithms & Optimisation:** Graph algorithms, scheduling and resource allocation, dynamic programming, constraint satisfaction, topological sorting, optimisation theory
- **Agentic AI & LLM Systems:** Agentic orchestration and workflow automation, multi-model evaluation, prompt engineering, LLM API integration (Claude, OpenAI), decision automation pipelines
- **DevOps & Deployment:** CI/CD, automated testing (Playwright/TypeScript, pytest), production monitoring, security hardening (SSH keys, fail2ban, UFW), containerisation, Chrome headless automation
- **Methodologies:** Agile/Scrum, milestone-driven incremental delivery, requirements-first architecture, TDD, AI pair programming (Claude) for design review and delivery acceleration

EXPERIENCE

Lead Developer & Full-Stack Engineer — FlowSolutions · Remote Jun 2024 – Present

- Leading development of an AI-powered real-time platform coordinating multi-channel messaging across WhatsApp, Telegram, Discord, Instagram, and Messenger via Go (Fiber) backend with WebSocket event synchronisation
- Architected stateful backend systems: designed real-time notification hubs and operational state management synchronising task data across multiple distributed services and client connections via WebSocket
- Implemented security layer: JWT authentication, OAuth2 flows, and TOTP/2FA across all platform services; owned data integrity and access control in multi-service environment
- Built end-to-end test infrastructure (Playwright/TypeScript) covering critical user flows and multi-channel integration paths; managed gRPC service communication, OpenAI API integration, Stripe payments, and database layer (MongoDB, SQLite)

Developer — Automated Data Pipeline, ML Classifier & VPS Infrastructure · Python, Docker, Go May 2026 – Present

- Designed and deployed a complete multi-service system on production Ubuntu VPS: data collection pipeline (REST APIs, web scraping), ML classification service, and Telegram orchestration bot for real-time control and monitoring
- Engineered system hardening from first principles: SSH key-only authentication, fail2ban brute-force protection, UFW deny-by-default firewall, and full containerisation across three services with Docker Compose for reliability and reproducibility
- Built data ingestion pipeline with residential proxy rotation for anti-bot resilience; orjson deduplication processes 10k+ records across multiple sources in under 1ms; integrated Claude API for automated single-shot document generation and Chrome headless PDF pipeline on Linux

Team Lead & Developer — IDE & Version Control System for Semiconductor Manufacturing Client · Sheffield, UK Semester 2, 2024

- Led a 6-person team through three formal milestones delivering a custom IDE and version-control platform to a semiconductor manufacturing client; owned requirements capture through direct client interviews, architecture design, and weekly status management
- Reverse-engineered the client's undocumented proprietary programming language (no specification available) to build language-aware editor tooling and shipped GitHub-style version tracking in production use
- Understood operational constraints through iterative client feedback and architecture sign-off before implementation, translating field reality into product requirements

Developer — On-Chain Data Platforms & Systems Integration · Python, MongoDB · Syntagma Labs Jan 2026 – May 2026

- Built and deployed full-stack on-chain data dashboard (Python, MongoDB) tracking real-time market indicators, stablecoin de-pegging events, and blockchain fee dynamics
- Designed cross-chain arbitrage tracking system analysing price discrepancies and arbitrage opportunities across digital asset bridges; engineered Salesforce integration for wallet data retrieval via REST API

EDUCATION

BEng Software Engineering · University of Sheffield · Sheffield, UK

Research: "Multi-factor portfolio construction in digital assets, investigating portfolio-level optimisation and weighting methodologies for uncorrelated strategies."

High School Diploma · All Saints Catholic School · United Kingdom
